

## SOLAR ENERGY---RENEWABLE ENERGY

In the present times, the world has been adopting renewable power at rapid rate. India is also emerging in the global arena as a leading generator of renewable energy and has become the 2<sup>nd</sup> largest country in terms of solar power generation in the world.

Solar energy is environmental friendly. When in use, it does not release CO<sub>2</sub> and other gases which pollute the air. Solar power is inexhaustible. In an energy deficient country like India, where power generation is costly, solar energy is best alternate means of power generation.

In its efforts to move further towards sustainable development, our institute has installed solar panels in the year 2018 which has resulted in significant decrease in our electrical bills. We shall continue in our efforts to generate power from ecofriendly sources and ensure the sustainability of our planet.
